

It's Time to Replace Your Wallet with Mobile Tizen Devices!

Arron Wang

TIZEN[™]
**DEVELOPER
CONFERENCE**
2014
SAN FRANCISCO

Payment Overview

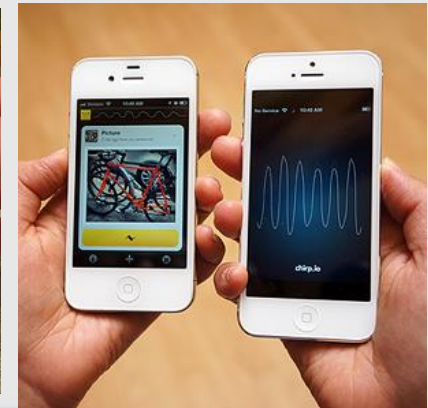

Traditional Payment

- Cash
- Paper Cheque
- Debit/Credit card
- Online transaction

Mobile Payment

- SMS based transaction
- Direct mobile billing
- QR code payment
- Audio signal-based payment
- **Contactless NFC payment**

Key Mobile Payment Characteristics

- **Security, privacy and trust**
- **Simplicity and usability**
- **Interoperability**
- **Universality**

Why NFC?

- **Security**(Based on Secure Element)
 - 1 SIM/UICC
 - 2 *Embedded secure element (eSE)*
 - 3 *Smart microSD*
- **Interoperability**(Industry Standards)
 - ETSI
 - GlobalPlatform
 - EMVCo
 - ISO/IEC
- **Universality**
- **Simplicity** (Tap & Pay)

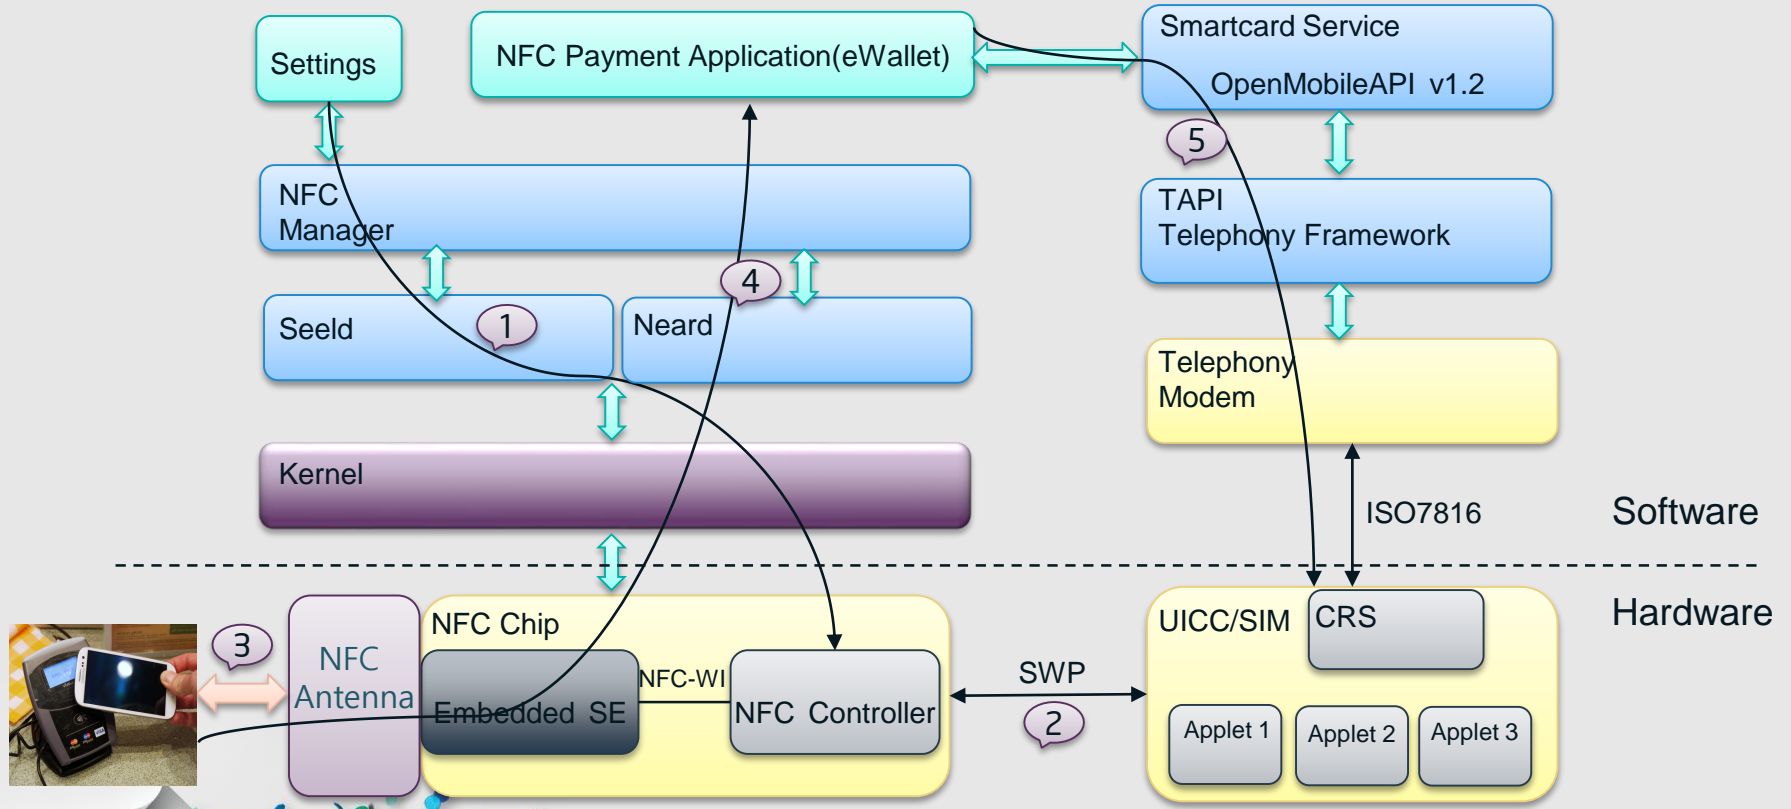

Key Communication Protocols for NFC Payment

- **SE and the mobile processor**
 - UICC: ISO7816
 - smart microSD: SD protocol
 - eSE: By default NFC CLF will export the API for user
- **SE and the NFC controller**
 - UICC: SWP/HCI
 - smart microSD: SWP/HCI
 - eSE: NFC-WI, SWP/HCI, I2C, SPI, DCLB
- **POS reader and the NFC controller**
 - NFC as a carrier
 - EMV Contactless

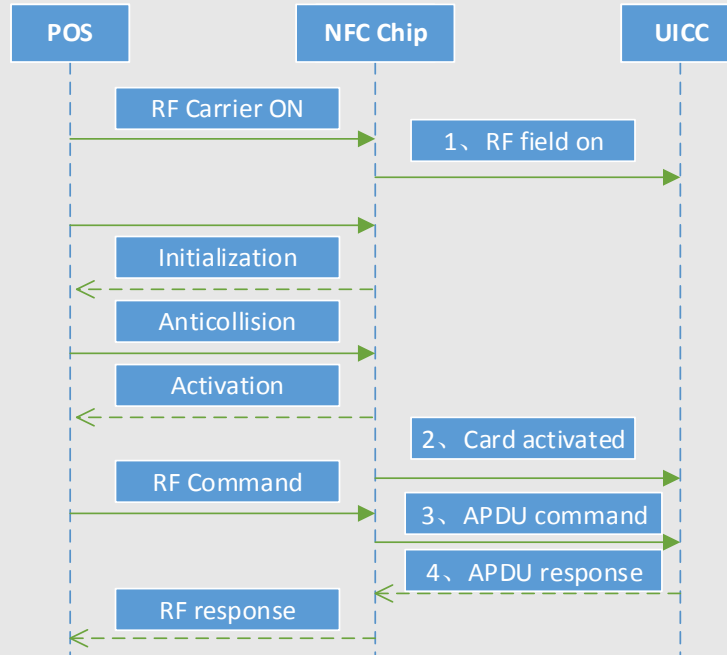

Tizen NFC Based Mobile Payment Architecture

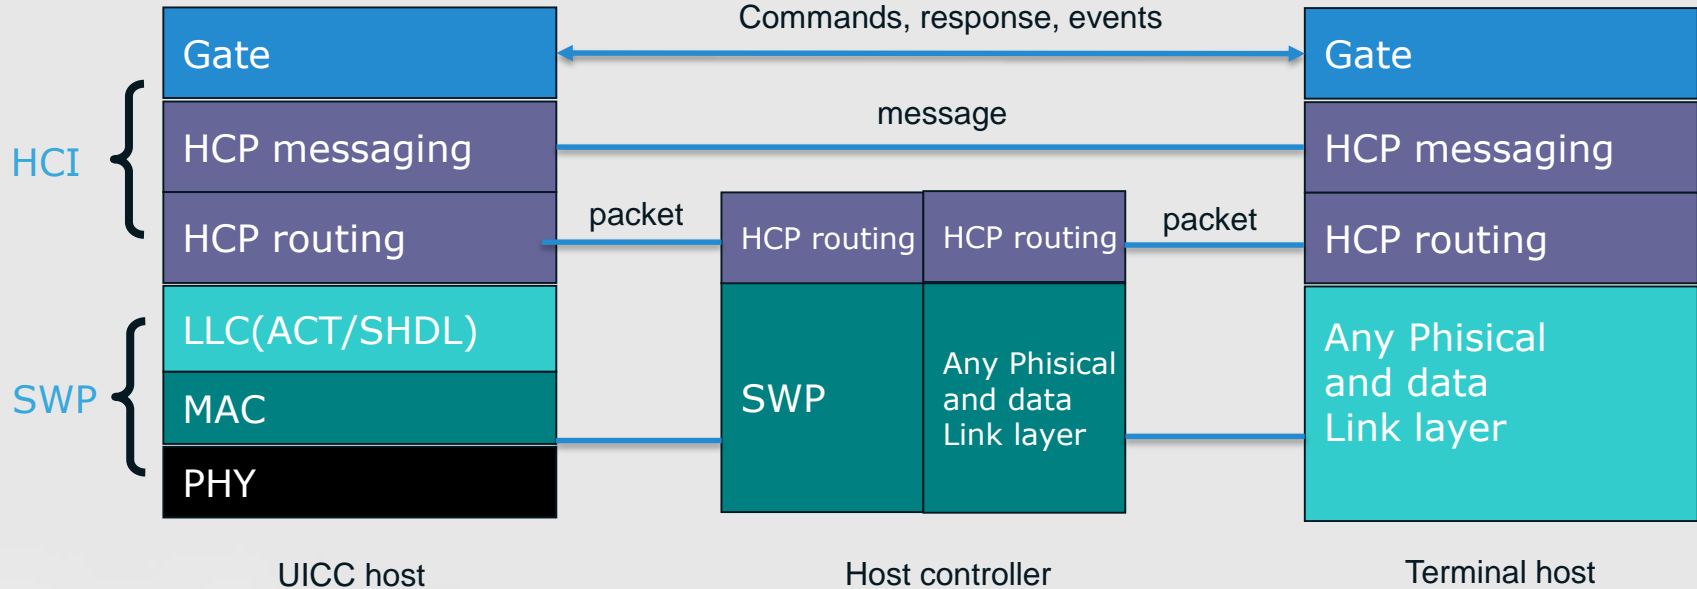

Tizen NFC Payment Architecture

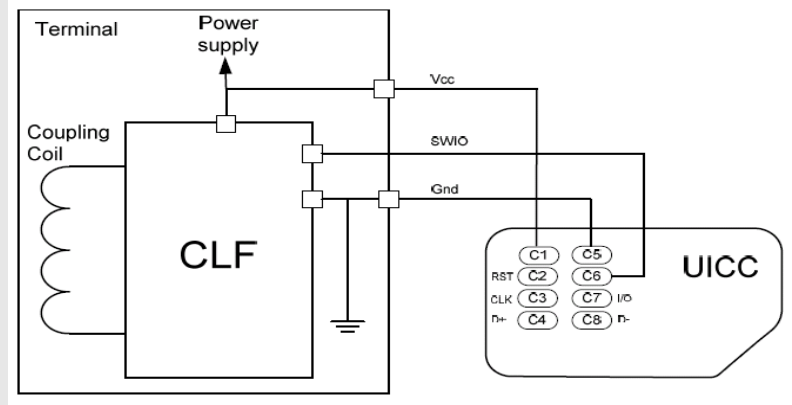

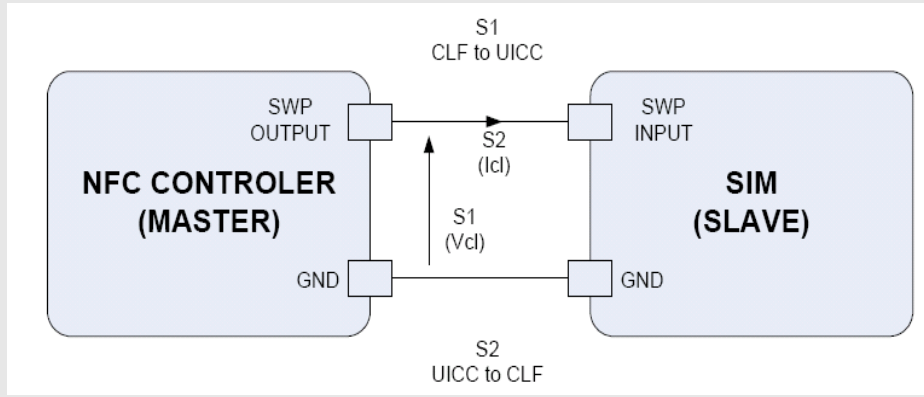

Transaction Procedure

HCI(Host Control Interface) Architecture

Contact between NFC & SIM

SWP

Enablement Tips

Checklist for NFC payment

- **NFC Chip**

- Chip hardware test
 - *NXP_SELF_TEST_ANTENNA*
 - *NXP_SELF_TEST_SWP*
- Chip secure element configuration
 - *NXP_SE_DEFAULTMODE*
 - *NXP_SWP_DEFAULTMODE*
 - *NXP_EVT_SWP_SWITCH_MODE*
 - *UICC_GateList*
- HCI configuration for host controller administration gate
 - WHITELIST
 - SESSION_IDENTITY
- Implemented in the kernel driver or the library from NFC vendor

Checklist for NFC payment(cont)

- **Secure Element Contactless Management (SECM)**
 - Contactless activation states
 - The priority of each application
- **Contactless Registry Service(CRS)**
 - An SECM entity for UICC
 - CRS application provide the user to active/deactive, change priority of applications on the contactless interface

Example of using CRS application

1、 Select the CRS application

```
sh-4.1# ./send-apdu /org/seeld/se/nfc0_uicc_se0/channel0 00:A4:04:00:09:A0:00:00:01:51:43:52:53:00
Response APDU [0x6f 0x16 0x84 0x9 0xa0 0x0 0x0 0x1 0x51 0x43 0x52 0x53 0x0 //CRS CRS Application AID TLV
               0xa5 0x9 // FCI Proprietary Template, length
               0x9f 0x8 0x2 0x1 0x0 //version
               0x80 0x2 0x0 0x11 //Global Update Counter
               0x90 0x0 ]
```

2、 Get the status of the contactless application on the card

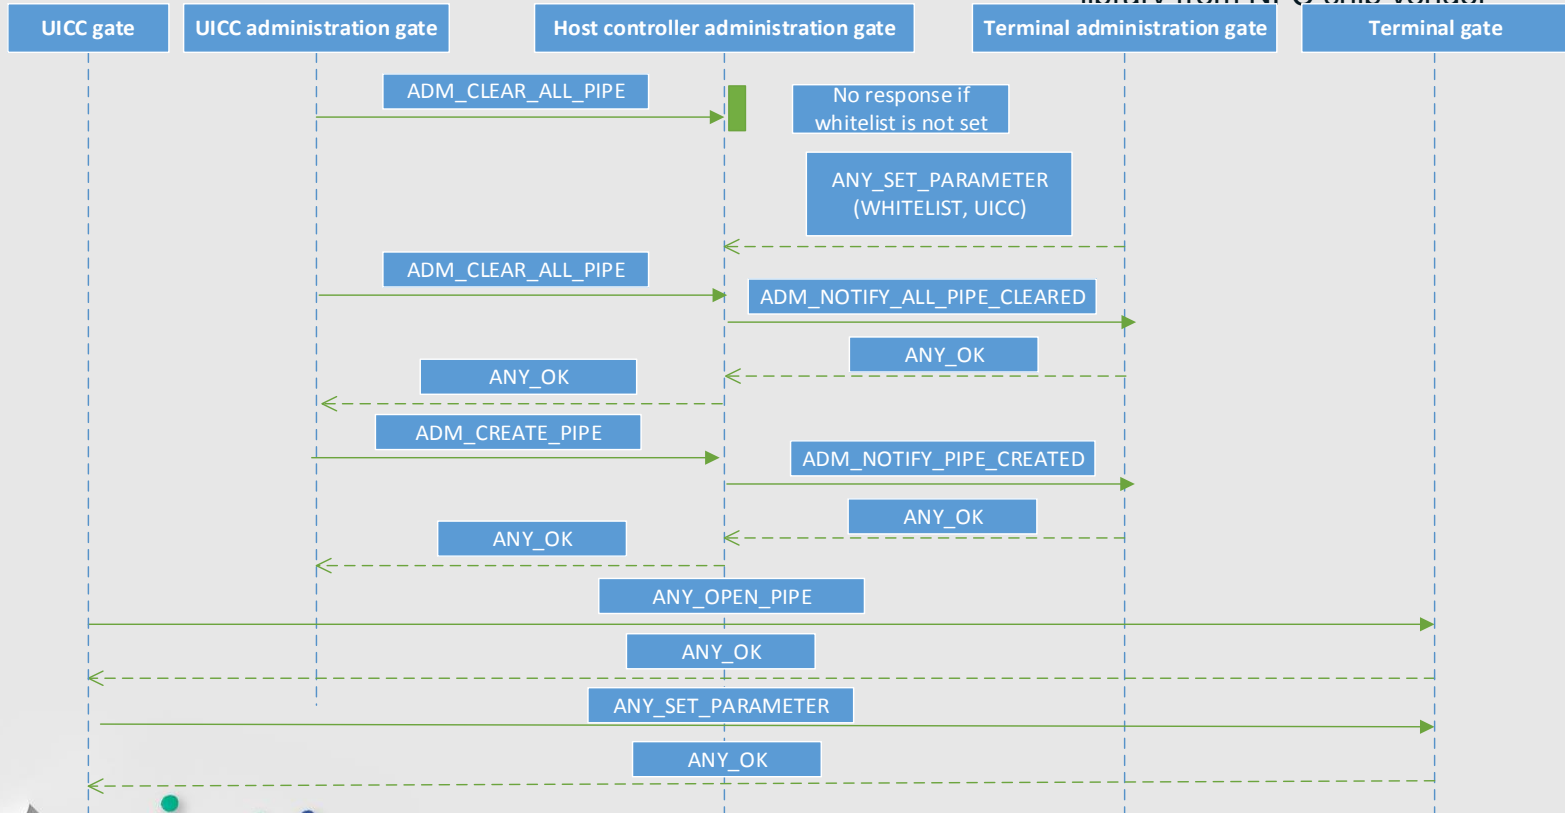

```
sh-4.1# ./send-apdu /org/seeld/se/nfc0_uicc_se0/channel0 80:F2:40:00:02:4F:00:00
Response APDU [0x61 0x1f // Application Template
               0x4f 0xe 0x32 0x50 0x41 0x59 0x2e 0x53 0x59 0x53 0x2e 0x44 0x44 0x46 0x30 0x31 // Application AID
               0x9f 0x70 0x2 0x7 0x0 // Application Lifecycle State, Activation State is encoded on the second byte, 00 is deactivated
               0x80 0x2 0x0 0x8 // Application Update Counter
               0x81 0x1 0x0 // Selection Priority
               0x88 0x1 0x0 // Display Required Indicator
```

3、 Update the status of selected application

```
sh-4.1# ./send-apdu /org/seeld/se/nfc0_uicc_se0/channel0
           80:F0://SET STATUS
           01://Status type: Availability State over the Contactless Interface
           01://Status value: Activated
           10:4F:0E:32:50:41:59:2E:53:59:53:2E:44:44:46:30:31:00
Response APDU [0x90 0x0 ]//operation successfulty
```

HCI Procedures

Need implement in kernel or library from NFC chip vendor

Runtime monitor SWP data between host and SE

```
SWP
  G HEXA : 5 bytes
  61 FE 5A AB B6
  B HEXA : 5 bytes
  F9 04 00 7D 9B
  G HEXA : 3 bytes
  E6 7C 18
  G HEXA : 5 bytes
  80 81 03 EF 0C
  B HEXA : 5 bytes
  81 81 80 79 D7
  G HEXA : 3 bytes
  C1 28 9D
  G HEXA : 6 bytes
  89 81 02 01 D0 A6
  B HEXA : 13 bytes
  8A 81 80 FF FF FF FF FF
  FF FF FF CD BA
  G HEXA : 3 bytes
  C2 18 FE
  G HEXA : 7 bytes
  92 81 14 1B 1C 4B 1E
  B HEXA : 3 bytes
  C3 08 DF
```

- 1、 CLF active SWP link, UICC return **ACT_SYNC** command, return the SYNC_ID of the card to CLF module
- 2、 CLF send U-Frame: **RSET** command F9, provide: endpoint window size and capability. window size=04
- 3、 UICC return response U-Frame: **UA**, acknowledge received RSET command and accept RSET command
- 4、 UICC send I-Frame: cmd=03=**ANY_OPEN_PIPE**, notify CLF to open pipeId=01.
- 5、 CLF send response I-Frame: response=00=ANY_OK, notify UICC open pipeId=01success
- 6、 UICC return S-Frame: Type=RR=Receive Ready.
- 7、 UICC send I-Frame: cmd=02=**ANY_GET_PARAMETER**, and registry=01, means get the argument is 8 byte SESSION_IDENTITY, default value all FF.
- 8、 CLF return response I-Frame: response=00=ANY_OK, and return SESSION_IDENTITY=FFFFFFFFFFFFFFFF.
- 9、 CLF return S-Frame: Type=RR=Receive Ready.
- 10、 UICC send I-Frame: cmd=14=**ADM_CLEAR_ALL_PIPE**
CLF should return response=00=ANY_OK but no response after that ☹
- 11、 CLF return S-Frame: Type=RR=Receive Ready.

```
